8.2.2	Minor Changes	68
	Python Module Index	69
	Index	71

Python job submission on torque and slurm clusters with dependency tracking. Allows simple job submission with *dependency tracking and queue waiting* on either torque, slurm, or locally with the multiprocessing module. It uses simple techniques to avoid overwhelming the queue and to catch bugs on the fly.

It is routinely tested on Mac OS and Linux with slurm and torque clusters, or in the absence of a cluster, on Python versions 2.7.10, 2.7.11, 2.7.12, 3.3.0, 3.4.0, 3.5.2, 3.6.2, and 3.7-dev. The full test suite is available in the `tests` folder.

Fyrd is pronounced ‘feared’ (sort of), it is an Anglo-Saxon term for an army, particularly an army of freemen (in this case an army of compute nodes). The logo is based on a Saxon shield commonly used by these groups. This software was formerly known as ‘Python Cluster’.

The code is hosted at github: <https://github.com/MikeDacre/fyrd>

To install, use PyPI:

```
pip install fyrd
fyrd conf init
```

Contents:

1.1 Simple Job Submission

At its simplest, this module can be used by just executing `submit(<command>)`, where `command` is a function or system command/shell script. The module will autodetect the cluster, generate an intuitive name, run the job, and write all outputs to files in the current directory. These can be cleaned with `clean_dir()`.

To run with dependency tracking, run:

```
import fyrd
job = fyrd.submit(<command1>)
job2 = fyrd.submit(<command2>, depends=job1)
out1, out2 = fyrd.get([job, job2]) # Will block until job completes
```

The `submit()` function is actually just a wrapper for the `Job` class. The same behavior as above can be obtained by initializing a `Job` object directly:

```
import fyrd
job = fyrd.Job(<command1>)
job.submit()
job2 = fyrd.Job(<command2>, depends=job1).submit()
out = job2.get() # Will block until job completes
```

Note that as shown above, the `submit` method returns the `Job` object, so it can be called on job initialization. Also note that the object returned by calling the `submit()` function (as in the first example) is also a `Job` object, so these two examples can be used fully interchangeably.

Similar wrappers allow you to submit and monitor existing job files, such as those made by other pipelines:

```
import os
import fyrd
jobs = []
job_dir = os.path.abspath('./jobs/')
for job in os.listdir(job_dir) if i.endswith('sh
↪')]:
```

```
jobs.append(fyrd.submit_file(job))
fyrd.wait(jobs)  # Will block until every job is completed
```

This type of thing can also be accomplished using the [console script](#):

```
fyrd run --wait ./jobs/*.sh
```

1.2 Functions

The submit function works well with python functions as well as with shell scripts and shell commands, in fact, this is the most powerful feature of this package. For example:

```
import fyrd
def raise_me(something, power=2):
    return something**power
outs = []
if __name__ == '__main__':
    for i in range(80):
        outs.append(fyrd.submit(raise_me, (i,), {'power': 4},
                                mem='10MB', time='00:00:30'))
    final_sum = 0
    for i in outs:
        final_sum += i.get()
    print(final_sum)
```

By default this will submit every instance as a job on the cluster, then get the results and clean up all intermediate files, and the code will work identically on a Mac with no cluster access, a slurm cluster, or a torque cluster, with no need to change syntax.

This is very powerful when combined with simple methods that split files or large python classes, to make this kind of work easier, a number of simple functions are provided in [the helpers module](#), to learn more about that, review the Advanced Usage section of this documentation.

Function submission works equally well for submitting methods, however the original class object will not be updated, the method return value will be accurate, but any changes the method makes to ``self`` will not be returned from the cluster and will be lost.

1.2.1 Possible Infinite Recursion Error

Warning: in order for function submission to work, *fyrd* ends up importing your original script file on the nodes. This means that all code in your file will be executed, so anything that isn't a function or class must be protected with an ``if __name__ == '__main__':`` protecting statement.

If you do not do this you can end up with multi-submission and infinite recursion, which could mess up your jobs or just crash the job, but either way, it won't be good.

This isn't true when submitting from an interactive session such as *ipython* or *jupyter*.

1.3 Using the Jobify Decorator

Function submission can be made much easier by using the ``jobify`` decorator.

Using the example above with a decorator, we can do this:

```
import fyrd
@fyrd.jobify(mem='10MB', time='00:00:30')
def raise_me(something, power=2):
    return something**power
outs = []
if __name__ == '__main__':
    for i in range(80):
        outs.append(raise_me(i, power=4))
    final_sum = 0
    for i in outs:
        final_sum += i.get()
    print(final_sum)
```

Here is a full, if silly, example with outputs:

```
>>> import fyrd
>>> @fyrd.jobify(name='test_job', mem='1GB')
... def test(string, iterations=4):
...     """This does basically nothing!"""
...     outstring = ""
...     for i in range(iterations):
...         outstring += "Version {0}: {1}".format(i, string)
...     return outstring
...
>>> test?
Signature: test(*args, **kwargs)
Docstring:
This is a fyrd.job.Job decorated function.

When you call it it will return a Job object from which you can get
the results with the ``.get()`` method.

Original Docstring:

This does basically nothing!
File:      ~/code/fyrd/fyrd/helpers.py
Type:      function
>>> j = test('hi')
>>> j.get()
'Version 0: hiVersion 1: hiVersion 2: hiVersion 3: hi'
```

You can see that the decorator also maintains the original docstring if it is implemented.

By default, the returned job will be submitted already, but you can override that behavior:

```
import fyrd
@fyrd.jobify(mem='10MB', time='00:00:30', submit=False)
def raise_me(something, power=2):
    return something**power
```

1.4 File Submission

If you want to just submit a job file that has already been created, either by this software or any other method, that can be done like this:

```
from fyrd import submit_file
submit_file('/path/to/script', dependencies=[7, 9])
```

This will return the job number and will enter the job into the queue as dependant on jobs 7 and 9. The dependencies can be omitted.

1.5 Keywords

The ``Job`` class, and therefore every submission script, accepts a large number of keyword arguments and synonyms to make job submission easy. Some good examples:

- cores
- mem (or memory)
- time (or walltime)
- partition (or queue)

The synonyms are provided to make submission easy for anyone familiar with the arguments used by either torque or slurm. For example:

```
job = Job('zcat huge_file | parse_file', cores=1, mem='30GB', time='24:00:00')
job = Job(my_parallel_function, cores=28, mem=12000, queue='high_mem')
for i in huge_list:
    out.append(submit(parser_function, i, cores=1, mem='1GB', partition='small'))
job = Job('ls /etc')
```

As you can see, optional keywords make submission very easy and flexible. The whole point of this software is to make working with a remote cluster in python as easy as possible.

For a full list of keyword arguments see the [Keyword Arguments](#) section of the documentation.

All options are defined in the `fyrd.options` module. If you want extra options, just submit an issue or add them yourself and send me a pull request.

1.6 Profiles

One of the issues with using keyword options is the nuisance of having to type them every time. More importantly, when writing code to work on any cluster one has to deal with heterogeneity between the clusters, such as the number of cores available on each node, or the name of the submission queue.

Because of this, *fyrd* makes use of profiles that bundle keyword arguments and give them a name, so that cluster submission can look like this:

```
job = Job('zcat huge_file | parse_file', profile='large')
job = Job(my_parallel_function, cores=28, profile='high_mem')
```

These profiles are defined in ``~/ .fyrd/profiles.txt`` by default and have the following syntax:

```
[large]
partition = normal
cores = 16
nodes = 1
time = 24:00:00
mem = 32000
```

This means that you can now do this:

```
Job(my_function, profile='large')
```

You can create as many of these as you like.

While you can edit the profile file directly to add and edit profile, it is easier and more stable to use the console script:

..code:: shell

```
fyrd profile list fyrd profile edit large time:02-00:00:00 mem=64GB fyrd profile edit DEFAULT parti-
tion:normal fyrd profile remove-option DEFAULT cores fyrd profile add silly cores:92 mem:1MB fyrd
profile delete silly
```

The advantage of using the console script is that argument parsing is done on editing the profiles, so any errors are caught at that time. If you edit the file manually, then any mistakes will cause an Exception to be raised when you try to submit a job.

If no arguments are given the default profile (called 'DEFAULT' in the `config` file) is used.

Note: any arguments in the DEFAULT profile are available in all profiles if they are not manually overridden there. The DEFAULT profile cannot be deleted. It is a good place to put the name of the default queue.

CHAPTER 2

Configuration

Many program parameters can be set in the config file, found by default at `~/.fyrd/config.txt`.

This file has three sections with the following defaults:

[queue]:

<code>max_jobs (int):</code>	sets the maximum number of running jobs before submission will pause and wait for the queue to empty
<code>sleep_len (int):</code>	sets the amount of time the program will wait between submission attempts
<code>queue_update (int):</code>	sets the amount of time between refreshes of the queue.
<code>res_time (int):</code>	Time in seconds to wait if a job is in an uncertain state, usually preempted or suspended. These jobs often resolve into running or completed again after some time so it makes sense to wait a bit, but not forever. The default is 45 minutes: 2700 seconds.
<code>queue_type (str):</code>	the type of queue to use, one of 'torque', 'slurm', 'local', 'auto'. Default is auto to auto-detect the queue.

[jobs]:

<code>clean_files (bool):</code>	means that by default files will be deleted when job completes
<code>clean_outputs (bool):</code>	is the same but for output files (they are saved first)
<code>file_block_time (int):</code>	Max amount of time to block after job completes in the queue while waiting for output files to appear. Some queues can take a long time to copy files under load, so it is worth setting this high, it won't block unless the files do not appear.
<code>filepath (str):</code>	Path to write all temp and output files by default, must be globally cluster accessible. Note: this is *not* the runtime path, just where files are written to.
<code>suffix (str):</code>	The suffix to use when writing scripts and output

```
auto_submit (bool):    files
                        If wait() or get() are called prior to submission,
                        auto-submit the job. Otherwise throws an error and
                        returns None
generic_python (bool): Use /usr/bin/env python instead of the current
                        executable, not advised, but sometimes necessary.
profile_file (str):    the config file where profiles are defined.
```

[jobqueue]:

Sets options for the local queue system, will be removed in the future in favor of database.

jobno (int): The current job number for the local queue, auto-increments with every submission.

Example file:

```
[queue]
res_time = 2700
queue_type = auto
sleep_len = 1
queue_update = 2
max_jobs = 1000
bool = True

[jobs]
suffix = cluster
file_block_time = 12
filepath = None
clean_outputs = False
auto_submit = True
profile_file = /Users/dacre/.fyrd/profiles.txt
clean_files = True
generic_python = False

[jobqueue]
jobno = 9
```

The config is managed by `fyrd/conf.py` and enforces a minimum set of entries. If the config does not exist or any entries are missing, they will be created on the fly using the defaults defined in the defaults.

Keyword Arguments

To make submission easier, this module defines a number of keyword arguments in the options.py file that can be used for all submission and Job() functions. These include things like ‘cores’ and ‘nodes’ and ‘mem’.

The following is a complete list of arguments that can be used in this version

depends clean_files clean_outputs cores modules syspaths scriptpath outpath runpath suffix outfile errfile
imports nodes features qos time mem partition account export begin

Note: Type is enforced, any provided argument must match that python type (automatic conversion is attempted), the default is just a recommendation and is not currently used. These arguments are passed like regular arguments to the submission and Job() functions, eg:

```
Job(nodes=1, cores=4, mem='20MB')
```

This will be interpreted correctly on any system. If torque or slurm are not available, any cluster arguments will be ignored. The module will attempt to honor the cores request, but if it exceeds the maximum number of cores on the local machine, then the request will be trimmed accordingly (i.e. a 50 core request will become 8 cores on an 8 core machine).

3.1 Adding your own keywords

There are many more options available for torque and slurm, to add your own, edit the options.py file, and look for CLUSTER_OPTS (or TORQUE/SLURM if your keyword option is only available on one system). Add your option using the same format as is present in that file. The format is:

```
('name', {'slurm': '--option-str={}', 'torque': '--torque-option={}',  
         'help': 'This is an option!', 'type': str, 'default': None})
```

You can also add list options, but they must include ‘sjoin’ and ‘tjoin’ keys to define how to merge the list for slurm and torque, or you must write custom option handling code in `fyrd.options.options_to_string()`. For an excellent example of both approaches included in a single option, see the ‘features’ keyword above.

This software is primarily intended to be a library, however some management tasks are just easier from the console. For that reason, *fyr*d has a frontend console script that makes tasks such as managing the local config and profiles trivial, it also has modes to inspect the queue easily, and to wait for jobs from the console, as well as to clean the working directory.

4.1 *fyr*d

This software has uses a subcommand system to separate modes, and has six modes:

- `run` - run an arbitrary shell script on the cluster
- `run-job` - run existing cluster script(s)
- `wait` - wait for a list of jobs
- `queue` - show running jobs, makes filtering jobs very easy
- `config` — show and edit the contents of the config file
- `profile` - inspect and manage cluster profiles
- `keywords` - print a list of current keyword arguments with descriptions for each
- `clean` - clean all script and output files in the given directory

Several of the commands have aliases (`conf` and `prof` being the two main ones)

4.1.1 Emailing

The `run`, `run-job`, and `wait` commands can all email you when they are done. To use this you need to configure the sending in the `~/fyrd/config.txt` file:

```
[notify]
mode = linux # Can be linux or smtp, linux uses the mail command
notify_address = your.address@gmail.com
# The following are only needed for smtp mode
smtp_host = smtp.gmail.com
smtp_port = 587
smtp_tls = True
smtp_from = your.server@gmail.com
smtp_user = None # Defaults to smtp_from
# This is insecure, so use an application specific password. This should
# be a read-only file with the SMTP password. After making it run:
# chmod 400 ~/.fyrd/smtp_pass
smtp_passfile = ~/.fyrd/smtp_pass
```

To enable emailing, pass `-n` (notify) to wait, or `-w -n` to the other two commands. You can also manually specify the address with `-e your.address@gmail.com`.

4.1.2 Examples

```
fyrd run 'samtools display big_file.bam | python $HOME/bin/my_parser.py > outfile'
fyrd run --profile long --args walltime=24:00:00,mem=20G --wait -n \
    'samtools display big_file.bam | python $HOME/bin/my_parser.py > outfile'
```

```
fyrd submit --wait -n ./jobs/*.sh
```

```
fyrd prof list
fyrd prof add large cores:92 mem:200GB partition:high_mem time:00:06:00
```

```
fyrd queue # Shows all of your current jobs
fyrd queue -a # Shows all users jobs
fyrd queue -p long -u bob dylan # Show all jobs owned by bob and dylan in the long_
↪queue
```

```
fyrd wait 19872 19876
fyrd wait -u john

# Will block until all of bob's jobs in the long queue finish
fyrd queue -p long -u bob -l | xargs fyrd wait
```

```
fyrd clean
```

4.1.3 All Options

fyrd:

```
usage: fyrd [-h] [-v] {run,submit,wait,queue,conf,prof,keywords,clean} ...
```

Manage fyrd config, profiles, **and** queue.

```
=====
Author      Michael D Dacre <mike.dacre@gmail.com>
Organization Stanford University
```

```

License      MIT License, use as you wish
Version      0.6.2a1
=====
positional arguments:
  {run,submit,wait,queue,conf,prof,keywords,clean}
  run (r)          Run simple shell scripts
  submit (sub, s)   Submit existing job files
  wait (w)          Wait for jobs
  queue (q)         Search the queue
  conf (config)     View and manage the config
  prof (profile)    Manage profiles
  keywords (keys, options)
                    Print available keyword arguments.
  clean            Clean up a job directory

optional arguments:
  -h, --help          show this help message and exit
  -v, --verbose       Show debug outputs

```

fyrd run:

```

usage: fyrd run [-h] [-p PROFILE] [-c CORES] [-m MEM] [-t TIME] [-a ARGS] [-w]
               [-k] [-l] [-n] [-e EMAIL] [-s] [-x EXTRA_VARS] [-d]
               [shell_script] [file_parsing [file_parsing ...]]

Run a shell script on the cluster and optionally wait for completion.

Allows the running of a single simple shell script, or the same shell script on
many files, or more complex file interpretation.

positional arguments:
  shell_script          The script to run
  file_parsing          The script to run

optional arguments:
  -h, --help          show this help message and exit
  -s, --simple          The amount of walltime to request
  -x EXTRA_VARS, --extra-vars EXTRA_VARS
                    Regex in form "new_var:orig_var:regex:sub,..."
  -d, --dry-run       Print commands instead of running them

Run Options:
  -p PROFILE, --profile PROFILE
                    The profile to use to run
  -c CORES, --cores CORES
                    The number of cores to request
  -m MEM, --mem MEM   The amount of memory to request
  -t TIME, --time TIME
                    The amount of walltime to request
  -a ARGS, --args ARGS
                    Submission args, e.g.:
                    'time=00:20:00,mem=20G,cores=10'
  -w, --wait          Wait for the job to complete
  -k, --keep          Keep submission scripts
  -l, --clean         Delete STDOUT and STDERR files when done

Notification Options:
  -n, --notify        Send notification email when done
  -e EMAIL, --email EMAIL

```

```
Email address to send notification to, default set in
~/.fyrd/config.txt
```

fyrd submit:

```
usage: fyrd submit [-h] [-p PROFILE] [-c CORES] [-m MEM] [-t TIME] [-a ARGS]
                  [-w] [-k] [-l] [-n] [-e EMAIL]
                  job_files [job_files ...]
```

Run a shell script on the cluster **and** optionally wait **for** completion.

Allows the running of a single simple shell script, **or** the same shell script on many files, **or** more **complex** file interpretation.

positional arguments:

job_files The script to run

optional arguments:

-h, --help show this help message **and** exit

Run Options:

```
-p PROFILE, --profile PROFILE    The profile to use to run
-c CORES, --cores CORES          The number of cores to request
-m MEM, --mem MEM                The amount of memory to request
-t TIME, --time TIME             The amount of walltime to request
-a ARGS, --args ARGS             Submission args, e.g.:
                                  'time=00:20:00,mem=20G,cores=10'
-w, --wait                       Wait for the job to complete
-k, --keep                       Keep submission scripts
-l, --clean                      Delete STDOUT and STDERR files when done
```

Notification Options:

```
-n, --notify                    Send notification email when done
-e EMAIL, --email EMAIL        Email address to send notification to, default set in
~/.fyrd/config.txt
```

fyrd wait:

```
usage: fyrd wait [-h] [-n] [-e EMAIL] [-u USERS] [jobs [jobs ...]]
```

Wait on a **list** of jobs, block until they complete.

positional arguments:

jobs Job **list** to wait **for**

optional arguments:

```
-h, --help                    show this help message and exit
-u USERS, --users USERS       A comma-separated list of users to wait for
```

Notification Options:

```
-n, --notify                    Send notification email when done
-e EMAIL, --email EMAIL        Email address to send notification to, default set in
~/.fyrd/config.txt
```

fyrd queue:

```
usage: fyrd queue [-h] [-u [...] | -a] [-p [...]] [-r | -q | -d | -b]
                  [-l | -c]
```

Check the local queue, similar to `squeue` or `qstat` but simpler, good for quickly checking the queue.

By default it searches only your own jobs, pass `'--all-users'` or `'--users <user> [<user2>...]` to change that behavior.

To just list jobs with some basic info, run with no arguments.

optional arguments:

`-h, --help` show this help message and exit

queue filtering:

`-u [...], --users [...]` Limit to these users
`-a, --all-users` Display jobs for all users
`-p [...], --partitions [...]` Limit to these partitions (queues)

queue state filtering:

`-r, --running` Show only running jobs
`-q, --queued` Show only queued jobs
`-d, --done` Show only completed jobs
`-b, --bad` Show only completed jobs

display options:

`-l, --list` Print job numbers only, works well with xargs
`-c, --count` Print job count only

fyrd conf:

```
usage: fyrd conf [-h] {show,list,help,update,alter,init} ...
```

This script allows display and management of the fyrd config file found here: `/home/dacre/.fyrd/config.txt`.

positional arguments:

`{show,list,help,update,alter,init}`
`show (list)` Show current config
`help` Show info on every config option
`update (alter)` Update the config
`init` Interactively initialize the config

optional arguments:

`-h, --help` show this help message and exit

Show usage::

```
fyrd conf show [-s <section>]
```

Update usage::

```
fyrd conf update <section> <option> <value>
```

Values can only be altered one at a time

To create a new config from scratch interactively::

```
fyrd conf init [--defaults]
```

fyrd prof:

```
usage: fyrd prof [-h]
                  {show,list,add,new,update,alter,edit,remove-option,del-option,delete,
↪del}
                  ...
```

Fyrd jobs use keyword arguments to run (for a complete list run this script with the keywords command). These keywords can be bundled into profiles, which are kept in /home/dacre/.fyrd/profiles.txt. This file can be edited directly or ↪manipulated here.

positional arguments:

```
{show,list,add,new,update,alter,edit,remove-option,del-option,delete,del}
  show (list)          Print current profiles
  add (new)            Add a new profile
  update (alter, edit) Update an existing profile
  remove-option (del-option) Remove a profile option
  delete (del)         Delete an existing profile
```

optional arguments:

```
-h, --help          show this help message and exit
```

Show::

```
fyrd prof show
```

Delete::

```
fyrd prof delete <name>
```

Update::

```
fyrd prof update <name> <options>
```

Add::

```
fyrd prof add <name> <options>
```

<options>:

```
The options arguments must be in the following format::
  opt:val opt2:val2 opt3:val3
```

Note: the DEFAULT profile is special and cannot be deleted, deleting it will cause it to be instantly recreated with the default values. Values from this profile will be available in EVERY other profile if they are not overridden there. i.e. if DEFAULT contains ``partition=normal``, if 'long' does not have a 'partition' option, it will default to 'normal'.

To reset the profile to defaults, just delete the file and run this script again.

fyrd keywords:

```
usage: fyrd keywords [-h] [-t | -s | -l]
```

optional arguments:

```
-h, --help          show this help message and exit
```

```
-t, --table          Print keywords as a table
-s, --split-tables  Print keywords as multiple tables
-l, --list           Print a list of keywords only
```

fyrd clean:

```
usage: fyrd clean [-h] [-o] [-s SUFFIX] [-q {torque,slurm,local}] [-n] [dir]
```

Clean **all** intermediate files created by the cluster module.

If **not** directory **is** passed, the default **if** either scriptpath **or** outpath are **set in** the config **is** to clean files **in** those locations **is** to clean those directories. If they are **not set**, the default **is** the current directory.

By default, outputs are **not** cleaned, to clean them too, **pass** '**-o**'

Caution:

The clean() function will delete ****EVERY**** file **with** extensions matching those these::

```
.<suffix>.err
.<suffix>.out
.<suffix>.sbatch & .fyrd.script for slurm mode
.<suffix>.qsub for torque mode
.<suffix> for local mode
_func.<suffix>.py
_func.<suffix>.py.pickle.in
_func.<suffix>.py.pickle.out
```

positional arguments:

```
dir          Directory to clean (optional)
```

optional arguments:

```
-h, --help          show this help message and exit
-o, --outputs       Clean output files too
-s SUFFIX, --suffix SUFFIX
                    Suffix to use for cleaning
-q {torque,slurm,local}, --qtype {torque,slurm,local}
                    Limit deletions to this qtype
-n, --no-confirm    Do not confirm before deleting (for scripts)
```

4.2 Aliases

Several shell scripts are provided in bin/ to provide shortcuts to the *fyrd* subcommands:

- frun: fyrd run
- fsub: fyrd submit
- my-queue (or myq): fyrd queue
- clean-job-files: fyrd clean
- monitor-jobs: fyrd wait
- cluster-keywords: fyrd keywords

Most of the important functionality is covered in the [Getting Started](#) section, and full details on the library are available in the [API Reference](#) section. This section just provides some extra information on Job and Queue management, and importantly introduces some of the higher-level options available through the [helpers](#).

5.1 The Job Class

The core of this submission system is the `Job` class, this class builds a job using keyword arguments and profile parsing. The bulk of this is done at class initialization and is covered in the getting started section of this documentation and on job submission with the `submit()` method. There are several other features of this class to be aware of though.

5.1.1 Script File Handling

Torque and slurm both require submission scripts to work. In the future these will be stored by `fyrd` in a database and submitted from memory, but for now they are written to disk.

The creation and writing of these scripts is handled by the `Script` and `Function` classes in the `fyrd.submission_scripts` module. These classes pass keywords to the `options_to_string()` function of the `options` method, which converts them into a submission string compatible with the active cluster. These are then written to a script for submission to the cluster.

The `Function` class has some additional functionality to allow easy submission of functions to the cluster. It tries to build a list of all possible modules that the function could need and adds import statements to all of them to the function submission script. It then pickles the submitted function and arguments to a pickle file on the disk, and writes a python script to the same directory.

This python script unpickles the function and arguments and runs them, pickling either the result or an exception, if one is raised, to the disk on completion. The submission script calls this python script on the cluster nodes.

The script and output files are written to the path defined by the `.filepath` attribute of the `Job` class, which is set using the 'filepath' keyword argument. If not set, this directory defaults to the directory set in the `filepath` section of the `config` file or the current working directory. Note that this path is independent of the `.runpath` attribute, which is where the code will actually run, and also defaults to the current working directory.

5.1.2 Job Output Handling and Retrieval

The correct way to get outputs from within a python session is to call the `.get()` method of the `Job` class. This first calls the `.wait()` method, which blocks until job completion, and then the `.fetch_outputs()` method which *calls `get_output`, `get_stdout`, and `get_stderr`, which save all function outputs, `STDOUT`, and `STDERR` to the class*. This means that outputs can be accessed using the following `Job` class attributes:

- `.output` — the function output for functions or `STDOUT` for scripts
- `.stdout` — the `STDOUT` for the script submission (always present)
- `.stderr` — the `STDERR` for the script submission (always present)

This makes job output retrieval very easy, but it is sometimes not what you want, particularly if outputs are very large (they get loaded into memory).

The `wait()` method will not save any outputs. In addition `get()` can be with the `save=False` argument, which means it will fetch the output (or `STDOUT`) only, but will not write them to the class itself.

Note: By default, `get()` also deletes all script and output files. This is generally a good thing as it keeps the working directory clean, but it isn't always what you want. To prevent outputs from being deleted, pass `delete_outfiles=False` to `get()`, or alternatively set the `.clean_outputs` attribute to `False` prior to running `get()`. To prevent the cleaning of any files, including the script files, pass `cleanup=False` or set `.clean_files` to `False`.

`clean_files` and `clean_outputs` can also be set globally in the config file.

5.2 Job Files

All jobs write out a job file before submission, even though this is not necessary (or useful) with multiprocessing. This will change in a future version.

To ensure files are obviously produced by this package and that files are unique the file format is `name.number.random_string.suffix.extension`. These are:

`name`: Defined by the `name=` argument or guessed from the function/script number: A number count of the total jobs with the same name already queued `random_string`: An 8-character random string `suffix`: A string defined in the config file, default 'cluster' `extension`: An obvious extension such as '.sbatch' or '.qsub'

To change the directory these files are written to, set the `filedir` item in the config file or use the 'filedir' keyword argument to `Job` or `submit`.

NOTE: This directory *must* be accessible to the compute nodes!!!

It is sometimes useful to set the `filedir` setting in the config to a single directory accessible cluster-wide. This avoids cluttering the current directory, particularly as outputs can be retrieved so easily from within python. If you are going to do this set the 'clean_files' and 'clean_outfiles' arguments in the config file to avoid cluttering the directory.

All `Job` objects have a `clean()` method that will delete any left over files. In addition there is a `clean_job_files` script that will delete all files made by this package in any given directory. Be very careful with the script though, it can clobber a lot of work all at once if it is used wrong.

5.3 Helpers

The `fyrd.helpers` module defines several simple functions that allow more complex job handling.

The helpers are all high level functions that are not required for the library but make difficult jobs easy to assist in the goal of trivially easy cluster submission.

5.3.1 Decorator

The `fyrd.helpers.jobify` (also imported as `fyrd.jobify`) allows you to decorate any function to make it submit to the cluster.

For example:

```
import fyrd
@fyrd.jobify(name='test_job', mem='1GB')
def test(string, iterations=4):
    """This does basically nothing!"""
    outstring = ""
    for i in range(iterations):
        outstring += "Version {0}: {1}".format(i, string)
    return outstring
```

The decorator also maintains the original docstring if it is implemented.

By default, the returned job will be submitted already, but you can override that behavior:

```
import fyrd
@fyrd.jobify(mem='10MB', time='00:00:30', submit=False)
def raise_me(something, power=2):
    return something**power
```

For more information, see the [basic usage info](#).

5.3.2 Pandas

The most important function in `fyrd.helpers` is `parapply()`, which allows the user to submit a `pandas.DataFrame.apply` method to the cluster in parallel by splitting the `DataFrame`, submitting jobs, and then recombining the `DataFrame` at the end, all without leaving any temp files behind. e.g.:

```
df = pandas.read_csv('my_huge_file.txt')
df = fyrd.helpers.parapply(100, df, long_running_function, profile='fast')
```

That command will split the dataframe into 100 pieces, submit each to the cluster as a different job with the profile 'fast', and then recombine them into a single `DataFrame` again at the end.

`parapply_summary` behaves similarly but assumes that the function summarizes the data rather than returning a `DataFrame` of the same size. It thus runs the function on the resulting `DataFrame` also, allowing all `dfs` to be merged. e.g.:

```
df = fyrd.helpers.parapply_summary(df, numpy.mean)
```

This will return just the mean of all the numeric columns, `parapply` would return a `DataFrame` with duplicates for every submitted job.

5.3.3 Running on a split file

The `splitrun` function behaves similarly to the `parapply()` function, with the exception that it works on a filesystem file instead, which it splits into pieces. It then runs your job on all of the pieces and attempts to recombine them, deleting the intermediate files as it goes.

If you specify an output file, the outputs are merged and places into that file, otherwise, if the outputs are a string (always true for scripts), the function returns a merged string. If the outputs are not strings, then the function just returns a list out outputs that you will have to combine yourself.

The key to this function is that if the job is a script, it must at a minimum contain ‘{file}’ where the file argument goes, and if the job is a function it must contain an argument or keyword argument that matches ‘<file>’.

If you expect the job to have an output, you must provide the `outfile=` argument too, and be sure that ‘{outfile}’ is present in the script, if a script, or ‘<outfile>’ is in either `args` or `kwargs` if a function.

In addition, you should pass `inheader=True` if the input file has a header line, and `outheader=True` if the same is true for the outfile. It is very important to pass these arguments, because they both will strip the top line from a file if `True`. Importantly, if `inheader` is `True` on a file without a header, the top line will appear at the top of every broken up file.

Examples:

```
script = """my_long_script --in {file} --out {outfile}"""
outfile = fyrd.helpers.splitrun(
    100, 'huge_file.txt', script, name='my_job', profile='long',
    outfile='output.txt', inheader=True, outheader=True
)
```

```
output = fyrd.helpers.splitrun(
    100, 'huge_file.txt', function, args=('<file>',), name='my_job',
    profile='long', outfile='output.txt', inheader=True, outheader=True
)
```

5.4 Queue Management

Queue handling is done by the `Queue` class in the `fyrd.queue` module. This class calls the `fyrd.queue.queue_parser` iterator which in turn calls either `fyrd.queue.torque_queue_parser` or `fyrd.queue.slurm_queue_parser` depending on the detected cluster environment (set by `fyrd.queue.QUEUE_MODE` and overridden by the ‘`queue_type`’ config option if desired (not necessary, queue type is auto-detected)).

These iterators return the following information from the queue:

```
job_id, name, userid, partition, state, node-list, node-count, cpu-per-node, exit-code
```

These pieces of information are used to create `QueueJob` objects for every job, which are stored in the `Queue.jobs` attribute (a dictionary). The `Queue` class provides several properties, attributes, and methods to allow easy filtering of these jobs.

Most important is the `QueueJob.state` attribute, which holds information on the current state of that job. To get a list of all states in the queue, call the `Queue.job_states` property, which will return a list of states in the queue. All of these states are also attributes of the `Queue` class, for example:

```
fyrd.Queue.completed
```

returns all completed jobs in the queue as a dictionary (a filtered copy of the `.jobs` attribute).

Note: torque states are auto-converted to slurm states, as slurm states are easier to read. e.g. ‘C’ becomes ‘completed’.

The most useful method of `Queue` is `wait()`, it will take a list of job numbers or `Job` objects and wait until all of them are complete. This method is called by the `Job.wait()` method, and can be called directly to wait for an arbitrary number of jobs.

Note, if you add the following to `~/.fyrd/config.txt` `wait` will automatically send an email when done:

```
[notify]
mode = linux # Can be linux or smtp, linux uses the mail command
```

```

notify_address = your.address@gmail.com
# The following are only needed for smtp mode
smtp_host = smtp.gmail.com
smtp_port = 587
smtp_tls = True
smtp_from = your.server@gmail.com
smtp_user = None # Defaults to smtp_from
# This is insecure, so use an application specific password. This should
# be a read-only file with the SMTP password. After making it run:
# chmod 400 ~/.fyrd/smtp_pass
smtp_passfile = ~/.fyrd/smtp_pass

```

To wait for all jobs from a given user, you can do this:

```

q = fyrd.Queue()
q.wait(q.get_user_jobs(['bob', 'fred']))

```

This task can also be accomplished with the console application:

```

fyrd wait <job> [<job>...]
fyrd wait -u bob fred

```

The method can actually be simply accessed as a function instead of needing the Queue class:

```

fyrd.wait([1,2,3])

```

To generate a Queue object, do the following:

```

import fyrd
q = fyrd.Queue(user='self')

```

This will give you a simple queue object containing a list of jobs that belong to you. If you do not provide user, all jobs are included for all users. You can provide `qt type` to explicitly force the queue object to contain jobs from one queuing system (e.g. local or torque).

To get a dictionary of all jobs, running jobs, queued jobs, and complete jobs, use:

```

q.jobs
q.running
q.complete
q.queued

```

Every job is a `QueueJob` class and has a number of attributes, including owner, nodes, cores, memory.

5.5 Config

Many of the important options used by this software are set in a config file and can be managed on the console with `fyrd conf`

For full information see the [Configuration](#) section of this documentation.

5.6 Logging

I use a custom logging script called `logme` to log errors. To get verbose output, set `fyrd.logme.MIN_LEVEL` to 'debug' or 'verbose'. To reduce output, set `logme.MIN_LEVEL` to 'warn'.

Adding Batch Systems

Fyrd is intended to be fully modular, meaning anyone should be able to implement support for any batch system, even other remote submission systems like DistributedPython *if* they are able to define the following functions and options.

To add a new batch system, you will need to:

1. Edit `__init__.py` to:
 - (a) Update `DEFINED_SYSTEMS` to include your batch system
 - (b) Edit `get_cluster_environment()` to detect your batch system, this function is ordered, meaning that it checks for slurm before torque, as slurm implements torque aliases. You should add a sensible way of detecting your batch system here.
2. Create a file in this directory with the name of your batch system (must match the name in `DEFINED_SYSTEMS`). This file must contain all constants and functions described below in the *Batch Script* section.
3. Edit `options.py` as described below in the *Options* section.
4. Run the pyenv test suite on your cluster system and make sure all tests pass on all versions of python supported by fyrd on your cluster system.
5. Optionally add a buildkite script on your cluster to allow CI testing. Note, this will technically give anyone with push privileges (i.e. me) the ability to execute code on your server. I promise to do no evil, but I can understand a degree of uncertainty regarding that. However, using buildkite will allow us to make sure that future updates don't break support for your batch system.
6. Become a fyrd maintainer! I always need help, if you want to contribute more, please do :-)

6.1 Options

Fyrd works primarily by converting batch system arguments (e.g. `-queue` for torque and `-partition` for slurm) into python keyword arguments. This is done by creating dictionaries in the `fyrd/batch_systems/options.py` file.

Option parsing is done on job creation by calling the `options.options_to_string()` function on the user provided keyword arguments. The primary point of this function is to convert all keyword arguments to string forms that can go at the top of your batch file prior to cluster submission. Therefore you *must* edit the dictionaries in `options.py` to include your batch system definitions. The most important section to edit is `CLUSTER_CORE`, this dictionary has sections for each batch system, e.g. for walltime:

```
('time',
 {'help': 'Walltime in HH:MM:SS',
  'default': '12:00:00', 'type': str,
  'slurm': '--time={}', 'torque': '-l walltime={}'})
```

This auto-converts the time argument provided by the user into `-time` for slurm and `-l walltime=` for torque.

As all systems are a little different, `options.options_to_string()` first calls the `parse_strange_options()` function in the batch system definition script to allow you the option to manually parse all options that cannot be handled so simply. Hopefully this function will do nothing, but return the input, but in some cases it makes sense for this function to handle every argument, an obvious example is when running using something like *multiprocessing* instead of a true batch system.

6.1.1 Batch Script

The defined batch script must have the name of your system and must define the following constants and functions in exactly the way described below. Your functions can do anything you want, and you can have extra functions in your file (maybe make them private with a leading `_` in the name), but the primary functions must take exactly the same arguments as those described below, and provide exactly the same return values.

6.1.2 Constants

- **PREFIX:** The string that will go before options at the top of a script file, could be blank for simple shell scripts, for slurm is is `#SBATCH`

6.1.3 Functions

`queue_test(warn=True)`

Input:

- **warn:** bool, warn on failure, optional

Output:

- **functional:** bool, True if this system can be used

Description:

Use this function to write code to test that your system can function. If you are using a specific command line tool in your code, consider adding it to the config file to allow users to specify an absolute path or alternate name.

Use a combination of `_run.which()` (which returns a full path to an executable if the executable is in the user's *PATH* and is executable) and `_run.is_exe()` (which tests if a file is executable) to check your command line tools.

Use the warn parameter with `_logme.log()` to set a log level, e.g.:

```
log_level = 'error' if warn else 'debug'
_logme.log('Cannot use me :-(', log_level)
```

Try not to raise any *Exceptions*, instead try to just log the problem and return *False*.

This code is run very frequently to test that the queue is usable, so make your code as simple and efficient as possible.

normalize_job_id(job_id)

Input:

- job_id: string, return value from job submission

Output:

- job_id: string, a normalized job id
- array_id: string or None, a normalized array job id

Description:

Take a string returned by your job submission script (e.g. *qsub*) and turn it into a normalized (hopefully string version of an int) job ID or process ID and an array_id, if that is implemented by your system. The array_id can be None if not implemented and should be None if not present (i.e. the job is not an array job).

normalize_state(state)

Input:

- state: string, a state description from the queue, e.g. 'running', or 'R'

Output:

- state: string, a state normalized into one of: - 'completed', - 'completing' - 'held' - 'pending' - 'running' - 'suspended' - 'running' - 'suspended'

gen_scripts(job_object, command, args, precmd, modstr)

Input:

- job_object: Job, a *fyrd.job.Job* object for the current job
- command: string, a string of the command to be run
- args: any additional arguments that are to be submitted, generally not used
- precmd: string, the batch system directives created by *options_to_string*, you can edit this or overwrite it if necessary
- modstr: string, a string of module imports (e.g. module load samtools) set by the user

Output:

- submission_script: *fyrd.submission_scripts.Script* object with the script to run
- exec_script: *fyrd.submission_scripts.Script* object with an additional script called by submission script if necessary, can be None

Description:

This is one of the more complex functions, but essentially you are going to just format the *fyrd.script_runners.CMND_RUNNER_TRACK* script using the objects in the inputs. This just makes an executable submission script, so you can build this anyway you want, you don't have to use the *CMND_RUNNER_TRACK* script. However, if you make your own script, the STDOUT must include timestamps like this:

```
date +%y-%m-%d-%H:%M:%S'
echo "Running {name}"
{command}
exitcode=$?
echo Done
date +%y-%m-%d-%H:%M:%S'
if [[ $exitcode != 0 ]]; then
    echo Exited with code: $exitcode >&2
fi
exit $exitcode
```

This is because we parse the first two and last 2/3 lines of the file to get the job runtimes and exit codes.

Here is an example function:

```
def gen_scripts(job_object, command, args, precmd, modstr):
    """Create script object for job, does not create a sep. exec script."""
    script = _os.path.join(job_object.scriptpath,
                           '{}.cluster.qsub'.format(job_object.name))

    sub_script = _scripts.CMND_RUNNER_TRACK.format(
        precmd=precmd, usedir=job_object.runpath, name=job_object.name,
        command=command
    )
    return _Script(script=sub_script, file_name=script), None
```

submit(file_name, dependencies=None, job=None, args=None, kwds=None)

Input:

- file_name: string, The path to the file to execute [required]
- dependencies: list, A list of dependencies (job objects or job numbers) [optional]
- job: fyrd.job.Job, A job object of the calling job (not always passed) [optional]
- args: list, A list of additional arguments (currently unused) [optional]
- kwargs: dict or str, A dictionary or string of 'arg:val,arg:val,...' (currently unused) [optional]

Output:

- job_id: string, A job number

Description:

This function must actually submit the job file, however you want it to. If possible, include dependency tracking, if that isn't possible, raise a `NotImplementedException`. You can make use of `fyrd.run.cmd`, which allows you to execute code directly on the terminal and can catch errors and retry submission however many times you choose (5 is a good number). It also returns the `exit_code`, `STDOUT`, and `STDERR` for the execution.

The job object is passed whenever a job is submitted using the normal submission process, and will contain all keyword arguments. If your batch system requires command line arguments, you can parse the keyword arguments with the `parse_strange_options` function and store them in the `submit_args` attribute of the Job object. You can then access that attribute in this submission function and pass them to `fyrd.run.cmd` (or any other method you choose) as command line arguments.

Note, this submit function can also be called on existing scripts without a job object, so your function *should not* require the job object. The `args` and `kwds` arguments exist to allow additional parsing, although they are currently

unused; right now args gets the contents of Job.submit_args and kwds gets the contents of the *additional_keywords* argument to Job.submit(). This argument is currently ignored by all batch scripts.

Please add as much error catching code as possible in the submit function, the *torque.py* example is a good one.

kill(job_ids)

Input:

- job_ids: list, A list of job numbers

Output:

- bool: True on success, False on failure

Immediately terminate the running jobs

queue_parser(user=None, partition=None)

Input:

- user: string, optional username to limit to
- partition: string, optional partition/queue to limit to

(Fine to ignore these arguments if they are not implemented on your system)

Yields (must be an iterator):

- job_id: string
- array_id: string, optional array job number
- name: string, a name for the job
- userid: string, user of the job (can be None)
- partition: string, partition running in (can be None)
- state: string a slurm-style string representation of the state
- nodelist: list, the nodes the job is running on
- numnodes: int, a count of the number of nodes
- threads_per_node: int, a count of the number of cores being used on each node
- exit_code: int, an exit_code (can be None if not exited yet) **Must** be an int if state == 'completed'. **must** be 0 if job completed successfully.

Description:

This is the iterator that is the core of the batch system definition. You must somehow be able to parse all of the currently running jobs and return the above information about every job. *If your batch system implements array jobs, this generator must yield one entry per array child, not parent job.*

parse_strange_options(option_dict)

Inputs:

- option_dict: dictionary, a dictionary of keywords from the *options.py* file prior to interpretation with *option_to_string*, allowing parsing of all unusual keywords.

Outputs:

- `outlist`: list, A list of **strings** that will be added to the top of the submit file
- `option_dict`: dictionary, A parsed version of `option_dict` with **all options not defined in the appropriate dictionaries in ‘options.py’ removed**.
- `other_args`: a list of parsed arguments to be passed at submit time, this will be added to the `submit_args` attribute of the Job or passed as the `args` argument to `submit`.

6.2 Summary

The modularity of this system is intended to make it easy to support any batch system, however it is possible that some systems won’t fit into the mold defined here. If that is the case, feel free to alter other parts of the code to make it work, but **be sure that all tests run successfully on every defined cluster on every supported version of python**. Feel free to reach out to me to request testing if you do not have access to any system.

7.1 fyrd.queue

The core class in this file is the `Queue()` class which does most of the queue management. In addition, `get_cluster_environment()` attempts to autodetect the cluster type (*torque*, *slurm*, *normal*) and sets the global cluster type for the whole file. Finally, the `wait()` function accepts a list of jobs and will block until those jobs are complete.

The `Queue` class relies on a few simple queue parsers defined by the `torque_queue_parser` and `slurm_queue_parser` functions. These call `qstat -x` or `squeue` and `sacct` to get job information, and yield a simple tuple of that data with the following members:

```
job_id, name, userid, partition, state, node-list, node-count, cpu-per-node, exit-code
```

The `Queue` class then converts this information into a `Queue.QueueJob` object and adds it to the internal `jobs` dictionary within the `Queue` class. This list is now the basis for all of the other functionality encoded by the `Queue` class. It can be accessed directly, or sliced by accessing the `completed`, `queued`, and `running` attributes of the `Queue` class, these are used to simply divide up the `jobs` dictionary to make finding information easy.

7.1.1 fyrd.queue.Queue

```
class fyrd.queue.Queue (user=None, partition=None, qtype=None)
```

Bases: `object`

A wrapper for all defined batch systems.

jobs

dict – A dictionary of all jobs in this queue in the form: *{jobid: Queue.QueueJob}*

finished

dict – A dictionary of all completed jobs, same format as `jobs`

bad

dict – A dictionary of all jobs with failed or unknown states, same format as `jobs`

active_job_count

int – Total jobs in the queue (including array job children)

max_jobs

int – The maximum number of jobs allowed in the queue

can_submit

bool – True if `active_job_count < max_jobs`, False otherwise

job_states

list – A list of the different states of jobs in this queue

active_job_count

int – A count of all jobs that are either pending or running in the current queue

can_submit

bool – True if total active jobs is less than `max_jobs`

users

set – A set of all users with active jobs

job_states

set – A set of all current job states

wait (*jobs*, *return_disp=False*)

Block until all jobs in *jobs* are complete.

get (*jobs*)

Get all results from a bunch of Job objects.

wait_to_submit (*max_jobs=None*)

Block until fewer running/pending jobs in queue than `max_jobs`.

update ()

Refresh the list of jobs from the server.

get_jobs (*key*)

Return a dict of jobs where state matches *key*.

get_user_jobs (*users*)

Return a dict of jobs for all all jobs by each user in *users*.

Can filter by user, queue type or partition on initialization.

Parameters

- **user** (*str*) – Optional username to filter the queue with. If `user='self'` or `'current'`, the current user will be used.
- **partition** (*str*) – Optional partition to filter the queue with.
- **qtype** (*str*) – one of the defined batch queues (e.g. `'slurm'`)

Methods

Queue.wait (*jobs*, *return_disp=False*, *notify=True*)

Block until all jobs in *jobs* are complete.

Update time is dependant upon the `queue_update` parameter in your `~/fyrd/config.txt` file.

Parameters

- **jobs** (*list*) – List of either `fyrd.job.Job`, `fyrd.queue.QueueJob`, `job_id`

- **return_disp** (*bool*, *optional*) – If a job disappears from the queue, return ‘disappeared’ instead of True
- **notify** (*str*, *True*, or *False*, *optional*) – If True, both notification address and wait_time must be set in the [notify] section of the config. A notification email will be sent if the time exceeds this time. This is the default. If a string is passed, notification is forced and the string must be the to address. False means no notification

Returns True on success False or None on failure unless return_disp is True and the job disappears, then returns ‘disappeared’

Return type `bool` or `str`

`Queue.get(jobs)`

Get all results from a bunch of Job objects.

Parameters **jobs** (*list*) – List of `fyrd.Job` objects

Returns **job_results** – `{job_id: Job}`

Return type `dict`

Raises `fyrd.ClusterError` – If any job fails or goes missing.

`Queue.wait_to_submit(max_jobs=None)`

Block until fewer running/queued jobs in queue than max_jobs.

Parameters **max_jobs** (*int*) – Override self.max_jobs for wait

`Queue.test_job_in_queue(job_id, array_id=None)`

Check to make sure job is in self.

Tries 12 times with 1 second between each. If found returns True, else False.

Parameters

- **job_id** (*str*) –
- **array_id** (*str*, *optional*) –

Returns `exists`

Return type `bool`

`Queue.get_jobs(key)`

Return a dict of jobs where state matches key.

`Queue.get_user_jobs(users)`

Filter jobs by user.

Parameters **users** (*list*) – A list of users/owners

Returns A filtered job dictionary of `{job_id: QueueJob}` for all jobs owned by the queried users.

Return type `dict`

`Queue.update()`

Refresh the list of jobs from the server, limit queries.

`Queue.check_dependencies(dependencies)`

Check if dependencies are running.

Parameters **dependencies** (*list*) – List of job IDs

Returns ‘active’ if dependencies are running or queued, ‘good’ if completed, ‘bad’ if failed, cancelled, or suspended, ‘absent’ otherwise.

Return type `str`

7.1.2 fyrd.queue Jobs

Hold information about individual jobs, `QueueJob` about primary jobs, `QueueChild` about individual array jobs (which are stored in the `children` attribute of `QueueJob` objects).

class `fyrd.queue.QueueJob`

A very simple class to store info about jobs in the queue.

Only used for torque and slurm queues.

id

int – Job ID

name

str – Job name

owner

str – User who owns the job

threads

int – Number of cores used by the job

queue

str – The queue/partition the job is running in

state

str – Current state of the job, normalized to slurm states

nodes

list – List of nodes job is running on

exitcode

int – Exit code of completed job

disappeared

bool – Job cannot be found in the queue anymore

array_job

bool – This job is an array job and has children

children

dict – If array job, list of child job numbers

Initialize.

class `fyrd.queue.QueueChild` (*parent*)

A very simple class to store info about child jobs in the queue.

Only used for torque and slurm queues.

id

int – Job ID

name

str – Job name

owner

str – User who owns the job

threads

int – Number of cores used by the job

queue*str* – The queue/partition the job is running in**state***str* – Current state of the job, normalized to slurm states**nodes***list* – List of nodes job is running on**exitcode***int* – Exit code of completed job**disappeared***bool* – Job cannot be found in the queue anymore**parent***QueueJob* – Backref to parent job

Initialize with a parent.

7.1.3 fyrd.queue.QueueError

exception `fyrd.queue.QueueError`

Simple Exception wrapper.

7.2 fyrd.job

Job management is handled by the `Job()` class. This is a very large class that defines all the methods required to build and submit a job to the cluster.

It accepts keyword arguments defined in `fyrd.options` on initialization, which are then fleshed out using profile information from the config files defined by `fyrd.conf`.

The primary argument on initialization is the function or script to submit.

Examples:

```
Job('ls -lah | grep myfile')
Job(print, ('hi',))
Job('echo hostname', profile='tiny')
Job(huge_function, args=(1,2) kwargs={'hi': 'there'},
    profile='long', cores=28, mem='200GB')
```

7.2.1 fyrd.job.Job

class `fyrd.Job(command, args=None, kwargs=None, name=None, qtype=None, profile=None, queue=None, **kws)`Bases: `object`

Information about a single job on the cluster.

Holds information about submit time, number of cores, the job script, and more.

Below are the core attributes and methods required to use this class, note that this is an incomplete list.

id*str* – The ID number for the job, only set once the job has been submitted

name

str – The name of the job

command

str or callable – The function or shell script that will be submitted

args

list – A list of arguments to the shell script or function in command

kwargs

dict – A dictionary of keyword arguments to the function (not shell script) in command

state

str –

A slurm-style one word description of the state of the job, one of:

- Not_Submitted
- queued
- running
- completed
- failed

submitted

bool

written

bool

done

bool

running

bool

dependencies

list – A list of dependencies associated with this job

out

str – The output of the function or a copy of stdout for a script

stdout

str – Any output to STDOUT

stderr

str – Any output to STDERR

exitcode

int – The exitcode of the running processes (the script runner if the Job is a function).

submit_time

datetime – A datetime object for the time of submission

start

datetime – A datetime object for time execution started on the remote node.

end

datetime – A datetime object for time execution ended on the remote node.

runtime

timedelta – A timedelta object containing runtime.

files

list – A list of script files associated with this job

nodes

list – A list of nodes associated with this job

modules

list – A list of modules associated with this job

clean_files

bool – If True, auto-delete script and function files on job completion

clean_outputs

bool – If True, auto-delete script outputs and error files on job completion

kwds

dict – Keyword arguments to the batch system (e.g. *mem*, *cores*, *walltime*), this is initialized by taking every additional keyword argument to the Job. e.g. `Job('echo hi', profile=large, walltime='00:20:00', mem='2GB')` will result in *kwds* containing `{walltime: '00:20:00', mem: '2GB'}`. There is **no need to alter this manually**.

submit_args

list – List of parsed submit arguments that will be passed at runtime to the submit function. **Generated within the Job object**, no need to set manually, use the *kwds* attribute instead.

initialize()

Use attributes to prep job for running

gen_scripts()

Create script files (but do not write them)

write(overwrite=True)

Write scripts to files

submit(wait_on_max_queue=True)

Submit the job if it is ready and the queue is sufficiently open.

resubmit(wait_on_max_queue=True)

Clean all internal states with *scrub()* and then resubmit

kill(confirm=True)

Immediately kill the currently running job

clean(delete_outputs=True, get_outputs=True)

Delete any files created by this object

scrub(confirm=True)

Clean everything and reset to an unrun state.

update(fetch_info=True)

Update our status from the queue

wait()

Block until the job is done

get()

Block until the job is done and then return the output (stdout if job is a script), by default saves all outputs to self (i.e. *.out*, *.stdout*, *.stderr*) and deletes all intermediate files before returning. If *save* argument is *False*, does not delete the output files by default.

Notes

Printing or reproducing the class will display detailed job information.

Both `wait()` and `get()` will update the queue every few seconds (defined by the `queue_update` item in the config) and add queue information to the job as they go.

If the job disappears from the queue with no information, it will be listed as 'completed'.

All jobs have a `.submission` attribute, which is a `Script` object containing the submission script for the job and the file name, plus a 'written' bool that checks if the file exists.

In addition, some batch systems (e.g. SLURM) have an `.exec_script` attribute, which is a `Script` object containing the shell command to run. This difference is due to the fact that some SLURM systems execute multiple lines of the submission file at the same time.

Finally, if the job command is a function, this object will also contain a `.function` attribute, which contains the script to run the function.

Initialization function arguments.

Parameters

- **command** (*function/str*) – The command or function to execute.
- **args** (*tuple/dict, optional*) – Optional arguments to add to command, particularly useful for functions.
- **kwargs** (*dict, optional*) – Optional keyword arguments to pass to the command, only used for functions.
- **name** (*str, optional*) – Optional name of the job. If not defined, guessed. If a job of the same name is already queued, an integer job number (not the queue number) will be added, ie. <name>.1
- **qtype** (*str, optional*) – Override the default queue type
- **profile** (*str, optional*) – The name of a profile saved in the conf
- **queue** (*fyrd.queue.Queue, optional*) – An already initiated Queue class to use.
- **kwds** – All other keywords are parsed into cluster keywords by the options system. For available keywords see `fyrd.option_help()`

Methods

`Job.initialize()`

Make self runnable using set attributes.

`Job.gen_scripts()`

Create the script objects from the set parameters.

`Job.write(overwrite=True)`

Write all scripts.

Parameters `overwrite` (*bool, optional*) – Overwrite existing files, defaults to True.

Returns `self`

Return type `Job`

`Job.clean(delete_outputs=None, get_outputs=True)`

Delete all scripts created by this module, if they were written.

Parameters

- **delete_outputs** (*bool*, *optional*) – also delete all output and err files, but get their contents first.
- **get_outputs** (*bool*, *optional*) – if delete_outputs, save outputs before deleting.

Returns *self***Return type** *Job***Job.scrub** (*confirm=True*)

Clean everything and reset to an unrun state.

Parameters **confirm** (*bool*, *optional*) – Get user input before proceeding**Returns** *self***Return type** *Job***Job.submit** (*wait_on_max_queue=True*, *additional_keywords=None*, *max_jobs=None*)

Submit this job.

To disable max_queue_len, set it to 0. None will allow override by the default settings in the config file, and any positive integer will be interpreted to be the maximum queue length.

Parameters

- **wait_on_max_queue** (*bool*, *optional*) – Block until queue limit is below the maximum before submitting.
- **additional_keywords** (*dict*, *optional*) – Pass this dictionary to the batch system submission function, not necessary.
- **max_jobs** (*int*, *optional*) – Override the maximum number of jobs to wait for

Returns *self***Return type** *Job***Job.resubmit** (*wait_on_max_queue=True*, *cancel_running=None*)

Attempt to auto resubmit, deletes prior files.

Parameters

- **wait_on_max_queue** (*bool*, *optional*) – Block until queue limit is below the maximum before submitting.
- **cancel_running** (*bool* or *None*, *optional*) – If the job is currently running, cancel it before resubmitting. If None (default), will ask the user.
- **disable max_queue_len, set it to 0. None will allow override by (To) –**
- **default settings in the config file, and any positive integer will (the) –**
- **interpreted to be the maximum queue length. (be) –**

Returns *self***Return type** *Job***Job.get_keywords** ()

Return a list of the keyword arguments used to make the job.

`Job.set_keywords(kwds, replace=False)`

Set the job keywords, just updates self.kwds.

Parameters

- **kwds** (*dict*) – Set of valid arguments.
- **replace** (*bool*, *optional*) – Overwrite the keyword arguments instead of updating.

`Job.wait()`

Block until job completes.

Returns **success** – True if exitcode == 0, False if not, ‘disappeared’ if job lost from queue.

Return type **bool** or **str**

`Job.get(save=True, cleanup=None, delete_outfiles=None, del_no_save=None, raise_on_error=True)`

Block until job completed and return output of script/function.

By default saves all outputs to this class and deletes all intermediate files.

Parameters

- **save** (*bool*, *optional*) – Save all outputs to the class also (advised)
- **cleanup** (*bool*, *optional*) – Clean all intermediate files after job completes.
- **delete_outfiles** (*bool*, *optional*) – Clean output files after job completes.
- **del_no_save** (*bool*, *optional*) – Delete output files even if *save* is *False*
- **raise_on_error** (*bool*, *optional*) – If the returned output is an Exception, raise it.

Returns Function output if Function, else STDOUT

Return type **str**

`Job.get_output(save=True, delete_file=None, update=True, raise_on_error=True)`

Get output of function or script.

This is the same as stdout for a script, or the function output for a function.

By default, output file is kept unless `delete_file` is True or `self.clean_files` is True.

Parameters

- **save** (*bool*, *optional*) – Save the output to self.out, default True. Would be a good idea to set to False if the output is huge.
- **delete_file** (*bool*, *optional*) – Delete the output file when getting
- **update** (*bool*, *optional*) – Update job info from queue first.
- **raise_on_error** (*bool*, *optional*) – If the returned output is an Exception, raise it.

Returns **output** – The output of the script or function. Always a string if script.

Return type anything

`Job.get_stdout(save=True, delete_file=None, update=True)`

Get stdout of function or script, same for both.

By default, output file is kept unless `delete_file` is True or `self.clean_files` is True.

Also sets self.start and self.end from the contents of STDOUT if possible.

Returns

- **save** (*bool, optional*) – Save the output to self.stdout, default True. Would be a good idea to set to False if the output is huge.
- **delete_file** (*bool, optional*) – Delete the stdout file when getting
- **update** (*bool, optional*) – Update job info from queue first.

Returns The contents of STDOUT, with runtime info and trailing newline removed.

Return type `str`

`Job.get_stderr (save=True, delete_file=None, update=True)`

Get stderr of function or script, same for both.

By default, output file is kept unless delete_file is True or self.clean_files is True.

Parameters

- **save** (*bool, optional*) – Save the output to self.stdout, default True. Would be a good idea to set to False if the output is huge.
- **delete_file** (*bool, optional*) – Delete the stdout file when getting
- **update** (*bool, optional*) – Update job info from queue first.

Returns The contents of STDERR, with trailing newline removed.

Return type `str`

`Job.get_times (update=True, stdout=None)`

Get stdout of function or script, same for both.

Sets self.start and self.end from the contents of STDOUT if possible.

Parameters

- **update** (*bool, optional*) – Update job info from queue first.
- **stdout** (*str, optional*) – Pass existing stdout for use

Returns

- **start** (*datetime.datetime*)
- **end** (*datetime.datetime*)

`Job.get_exitcode (update=True, stdout=None)`

Try to get the exitcode.

Parameters

- **update** (*bool, optional*) – Update job info from queue first.
- **stdout** (*str, optional*) – Pass existing stdout for use

Returns `exitcode`

Return type `int`

`Job.update (fetch_info=True)`

Update status from the queue.

Parameters **fetch_info** (*bool, optional*) – Fetch basic job info if complete.

Returns `self`

Return type `Job`

`Job.update_queue_info()`

Set (and return) `queue_info` from the queue even if done.

`Job.fetch_outputs(save=True, delete_files=None, get_stats=True)`

Save all outputs in their current state. No return value.

This method does not wait for job completion, but merely gets the outputs. To wait for job completion, use `get()` instead.

Parameters

- **save** (*bool*, *optional*) – Save all outputs to the class also (advised)
- **delete_files** (*bool*, *optional*) – Delete the output files when getting, only used if save is True
- **get_stats** (*bool*, *optional*) – Try to get exitcode.

7.3 fyrd.submission_scripts

This module defines to classes that are used to build the actual jobs for submission, including writing the files. Function is actually a child class of Script.

class `fyrd.submission_scripts.Script` (*file_name*, *script*)

Bases: `object`

A script string plus a file name.

Initialize the script and file name.

clean (*delete_output=None*)

Delete any files made by us.

exists

True if file is on disk, False if not.

write (*overwrite=True*)

Write the script file.

class `fyrd.submission_scripts.Function` (*file_name*, *function*, *args=None*, *kwargs=None*, *imports=None*, *syspaths=None*, *pickle_file=None*, *outfile=None*)

Bases: `fyrd.submission_scripts.Script`

A special Script used to run a function.

Create a function wrapper.

NOTE: Function submission will fail if the parent file's code is not wrapped in an `if __main__` wrapper.

Parameters

- **file_name** (*str*) – A root name to the outfiles
- **function** (*callable*) – Function handle.
- **args** (*tuple*, *optional*) – Arguments to the function as a tuple.
- **kwargs** (*dict*, *optional*) – Named keyword arguments to pass in the function call
- **imports** (*list*, *optional*) – A list of imports, if not provided, defaults to all current imports, which may not work if you use complex imports. The list can include the import call, or just be a name, e.g ['from os import path', 'sys']

- **sypaths** (*list*, *optional*) – Paths to be included in submitted function
- **pickle_file** (*str*, *optional*) – The file to hold the function.
- **outfile** (*str*, *optional*) – The file to hold the output.

clean (*delete_output=False*)

Delete the input pickle file and any scripts.

Parameters **delete_output** (*bool*, *optional*) – Delete the output pickle file too.

write (*overwrite=True*)

Write the pickle file and call the parent Script write function.

7.4 fyrd.batch_systems

All batch systems are defined here.

7.4.1 fyrd.batch_systems functions

`fyrd.batch_systems.get_cluster_environment` (*overwrite=False*)

Detect the local cluster environment and set MODE globally.

Detect the current batch system by looking for command line utilities. Order is important here, so we hard code the batch system lookups.

Paths to files can also be set in the config file.

Parameters **overwrite** (*bool*, *optional*) – If True, run checks anyway, otherwise just accept MODE if it is already set.

Returns **MODE**

Return type *str*

`fyrd.batch_systems.check_queue` (*qtype=None*)

Check if *both* MODE and qtype are valid.

First checks the MODE global and autodetects its value, if that fails, no other tests are done, the qtype argument is ignored.

After MODE is found to be a reasonable value, the queried queue is tested for functionality. If qtype is defined, this queue is tested, else the queue in MODE is tested.

Tests are defined per batch system.

Parameters **qtype** (*str*) –

Returns **batch_system_functional**

Return type *bool*

Raises `ClusterError` – If MODE or qtype is not in `DEFINED_SYSTEMS`

See also:

get_cluster_environment () Auto detect the batch environment

get_batch_system () Return the batch system module

```
fyrd.batch_systems.get_batch_system(qtype=None)
```

Return a batch_system module.

7.4.2 fyrd.batch_systems.options

All **keyword arguments** are defined in dictionaries in the `options.py` file, alongside function to manage those dictionaries. Of particular importance is `option_help()`, which can display all of the keyword arguments as a string or a table. `check_arguments()` checks a dictionary to make sure that the arguments are allowed (i.e. defined), it is called on all keyword arguments in the package.

To see keywords, run `fyrd keywords` from the console or `fyrd.option_help()` from a python session.

The way that option handling works in general, is that all hard-coded keyword arguments must contain a dictionary entry for ‘torque’ and ‘slurm’, as well as a type declaration. If the type is `NoneType`, then the option is assumed to be a boolean option. If it has a type though, `check_argument()` attempts to cast the type and specific idiosyncrasies are handled in this step, e.g. memory is converted into an integer of MB. Once the arguments are sanitized `format()` is called on the string held in either the ‘torque’ or the ‘slurm’ values, and the formatted string is then used as an option. If the type is a list/tuple, the ‘sjoin’ and ‘tjoin’ dictionary keys must exist, and are used to handle joining.

The following two functions are used to manage this formatting step.

`option_to_string()` will take an option/value pair and return an appropriate string that can be used in the current queue mode. If the option is not implemented in the current mode, a debug message is printed to the console and an empty string is returned.

`options_to_string()` is a wrapper around `option_to_string()` and can handle a whole dictionary of arguments, it explicitly handle arguments that cannot be managed using a simple string format.

```
fyrd.batch_systems.options.option_help(mode='string', qtype=None, tablefmt='simple')
```

Print a sting to stdout displaying information on all options.

The possible run modes for this extension are:

string	Return a formatted string
print	Print the string to stdout
list	Return a simple list of keywords
table	Return a table of lists
merged_table	Combine all keywords into a single table

Parameters

- **mode** (`{'string', 'print', 'list', 'table', 'merged_table'}`, optional) –
- **qtype** (`str`, optional) – If provided only return info on that queue type.
- **tablefmt** (`str`, optional) – A tabulate-style table format, one of:

```
'plain', 'simple', 'grid', 'pipe', 'orgtbl',  
'rst', 'mediawiki', 'latex', 'latex_booktabs'
```

Returns A formatted string

Return type `str`

```
fyrd.batch_systems.options.sanitize_arguments(kwds)
```

Run `check_arguments`, but return unmatched keywords as is.

`fyrd.batch_systems.options.split_keywords` (*kwargs*)

Split a dictionary of keyword arguments into two dictionaries.

The first dictionary will contain valid arguments for fyrd, the second will contain all others.

Returns `valid_args`, `other_args`

Return type `dict`

`fyrd.batch_systems.options.check_arguments` (*kwargs*)

Make sure all keywords are allowed.

Raises `OptionsError` on error, returns sanitized dictionary on success.

Note: Checks in `SYNONYMS` if argument is not recognized, raises `OptionsError` if it is not found there either.

`fyrd.batch_systems.options.options_to_string` (*option_dict*, *qtype=None*)

Return a multi-line string for job submission.

This function pre-parses options and then passes them to the `parse_strange_options` function of each batch system, before using the `option_to_string` function to parse the remaining options.

Parameters

- **option_dict** (*dict*) – Dict in format {option: value} where value can be None. If value is None, default used.
- **qtype** (*str*) – The defined batch system

Returns

- **parsed_options** (*str*) – A multi-line string of parsed options
- **runtime_options** (*list*) – A list of parsed options to be used at submit time

`fyrd.batch_systems.options.option_to_string` (*option*, *value=None*, *qtype=None*)

Return a string with an appropriate flag for slurm or torque.

Parameters

- **option** (*str*) – An allowed option defined in `options.all_options`
- **value** (*str*, *optional*) – A value for that option if required (if None, default used)
- **qtype** (*str*, *optional*) – One of the defined batch systems

Returns A string with the appropriate flags for the active queue.

Return type `str`

7.5 fyrd.conf

`fyrd.conf` handles the config (`~/ .fyrd/config.txt`) file and the profiles (`~/ .fyrd/profiles.txt`) file.

Profiles are combinations of keyword arguments that can be called in any of the submission functions. Both the config and profiles are just `ConfigParser` objects, `conf.py` merely adds an abstraction layer on top of this to maintain the integrity of the files.

7.5.1 config

The config has three sections (and no defaults):

- `queue` — sets options for handling the queue
- `jobs` — sets options for submitting jobs
- `jobqueue` — local option handling, will be removed in the future

For a complete reference, see the config documentation : [Configuration](#)

Options can be managed with the `get_option()` and `set_option()` functions, but it is actually easier to use the console script:

```
fyrd conf list
fyrd conf edit max_jobs 3000
```

`fyrd.conf.get_option(section=None, key=None, default=None)`

Get a single key or section.

All args are optional, if they are missing, the parent section or entire config will be returned.

Parameters

- **section** (*str*) – The config section to use (e.g. `queue`), if `None`, all sections returned.
- **key** (*str*) – The config key to get (e.g. `'max_jobs'`), if `None`, whole section returned.
- **default** – If the key does not exist, create it with this default value.

Returns Option value if key exists, `None` if no key exists.

Return type `option_value`

See also:

set_option() Set an option

get_config() Get the entire config

`fyrd.conf.set_option(section, key, value)`

Write a config key to the config file.

Parameters

- **section** (*str*) – Section of the config file to use.
- **key** (*str*) – Key to add.
- **value** – Value to add for key.

Returns

Return type `ConfigParser`

`fyrd.conf.delete(section, key)`

Delete a config item.

Parameters

- **section** (*str*) – Section of config file.
- **key** (*str*) – Key to delete

Returns

Return type ConfigParger

`fyrd.conf.load_config()`
Load config from the config file.

If any section or key from DEFAULTS is not present in the config, it is added back, enforcing a minimal configuration.

Returns

Return type ConfigParser

`fyrd.conf.write_config()`
Write the current config to CONFIG_FILE.

`fyrd.conf.create_config(cnf=None, def_queue=None)`
Create an initial config file.

Gets all information from the file-wide DEFAULTS constant and overwrites specific keys using the values in `cnf`.

This means that any records in the `cnf` dict that are not present in DEFAULTS will be ignored, and any records that are absent will be populated from DEFAULTS.

Parameters

- **cnf** (*dict*) – A dictionary of config defaults.
- **def_queue** (*str*) – A name for a queue to add to the default profile.

`fyrd.conf.create_config_interactive(prompt=True)`
Interact with the user to create a new config.

Uses readline autocompletion to make setup easier.

Parameters **prompt** (*bool*) – As for confirmation before beginning wizard.

7.5.2 profiles

Profiles are wrapped in a `Profile()` class to make attribute access easy, but they are fundamentally just dictionaries of keyword arguments. They can be created with `cluster.conf.Profile(name, {keywds})` and then written to a file with the `write()` method.

The easiest way to interact with profiles is not with class but with the `get_profile()`, `set_profile()`, and `del_profile()` functions. These make it very easy to go from a dictionary of keywords to a profile.

Profiles can then be called with the `profile=` keyword in any submission function or Job class.

As with the config, profile management is the easiest and most stable when using the console script:

```
fyrd profile list
fyrd profile add very_long walltime:120:00:00
fyrd profile edit default partition:normal cores:4 mem:10GB
fyrd profile delete small
```

fyrd.conf.Profile

class `fyrd.conf.Profile(name, kwds)`
Bases: `object`

A job submission profile. Just a thin wrapper around a dict.

name
str

kwds
dict

write : Write self to config file

Set up bare minimum attributes.

Parameters

- **name** (*str*) – Name of the profile
- **kwds** (*dict*) – Dictionary of keyword arguments (will be validated).

write()
Write self to config file.

`fyrd.conf.set_profile(name, kwds, update=True)`
Write profile to config file.

Parameters

- **name** (*str*) – The name of the profile to add/edit.
- **kwds** (*dict*) – Keyword arguments to add to the profile.
- **update** (*bool*) – Update the profile rather than overwriting it.

`fyrd.conf.get_profile(profile=None, allow_none=True)`
Return a profile if it exists, if None, return all profiles.

Will return None if profile is supplied but does not exist.

Parameters

- **profile** (*str*) – The name of a profile to search for.
- **allow_none** (*bool*) – If True, return None if no profile matches, otherwise raise a `ValueError`.

Returns The requested profile.

Return type *fyrd.conf.Profile*

7.6 fyrd.helpers

The helpers are all high level functions that are not required for the library but make difficult jobs easy to assist in the goal of trivially easy cluster submission.

The functions in `fyrd.basic` below are different in that they provide simple job submission and management, while the functions in `fyrd.helpers` allow the submission of many jobs.

`fyrd.helpers.jobify(name=None, profile=None, qtype=None, submit=True, **kwds)`
Decorator to make any function a job.

Will make any function return a Job object that will execute the function on the cluster.

If `submit` is `True`, the job will be submitted when it is returned.

Usage:

```
@fyrd.jobify(name='my_job', profile='small', mem='8GB',
             time='00:10:00', imports=['from time import sleep'])
def do_something(file_path, iteration_count=24):
    for i in range(iteration_count):
        print(file_path + i)
        sleep(1)
    return file_path

job = do_something('my_file.txt')
out = job.get()
```

Parameters

- **name** (*str*, *optional*) – Optional name of the job. If not defined, guessed. If a job of the same name is already queued, an integer job number (not the queue number) will be added, ie. <name>.1
- **qtype** (*str*, *optional*) – Override the default queue type
- **profile** (*str*, *optional*) – The name of a profile saved in the conf
- **submit** (*bool*, *optional*) – Submit the Job before returning it
- **kws** – All other keywords are parsed into cluster keywords by the options system. For available keywords see `fyrd.option_help()`

Returns A Job class initialized with the decorated function.

Return type `fyrd.job.Job`

Examples

```
>>> import fyrd
>>> @fyrd.jobify(name='test_job', mem='1GB')
... def test(string, iterations=4):
...     """This does basically nothing!"""
...     outstring = ""
...     for i in range(iterations):
...         outstring += "Version {0}: {1}".format(i, string)
...     return outstring
>>> j = test('hi')
>>> j.get()
'Version 0: hiVersion 1: hiVersion 2: hiVersion 3: hiVersion 4: hi'
```

`fyrd.helpers.parapply(jobs, df, func, args=(), profile=None, applymap=False, merge_axis=0, merge_apply=False, name='parapply', imports=None, direct=True, **kws)`
Split a dataframe, run apply in parallel, return result.

This function will split a dataframe into however many pieces are requested with the jobs argument, run apply in parallel by submitting the jobs to the cluster, and then recombine the outputs.

If the 'clean_files' and 'clean_outputs' arguments are not passed, we delete all intermediate files and output files by default.

This function will take any keyword arguments accepted by Job, which can be found by running `fyrd.options.option_help()`. It also accepts any of the keywords accepted by `pandas.DataFrame.apply()`, found [here](#)

Parameters

- **jobs** (*int*) – Number of pieces to split the dataframe into
- **df** (*DataFrame*) – Any pandas DataFrame
- **args** (*tuple*) – Positional arguments to pass to the function, keyword arguments can just be passed directly.
- **profile** (*str*) – A fyrd cluster profile to use
- **applymap** (*bool*) – Run applymap() instead of apply()
- **merge_axis** (*int*) – Which axis to merge on, 0 or 1, default is 1 as apply transposes columns
- **merge_apply** (*bool*) – Apply the function on the merged dataframe also
- **name** (*str*) – A prefix name for all of the jobs
- **imports** (*list*) – A list of imports in any format, e.g. [*'import numpy', 'scipy', 'from numpy import mean'*]
- **direct** (*bool*) – Whether to run the function directly or to return a Job. Default True.
- **keyword arguments recognized by fyrd will be used for job** (*Any*) –
- **submission.** –
- **keyword arguments will be passed to DataFrame.apply()** (**Additional*) –

Returns A recombined DataFrame: concatenated version of original split DataFrame

Return type DataFrame

Example

```
>>> import numpy
>>> import pandas
>>> import fyrd
>>> df = pandas.DataFrame([[0, 1], [2, 6], [9, 24], [13, 76], [4, 12]])
>>> df['sum'] = fyrd.helpers.parapply(2, df, lambda x: x[0]+x[1], axis=1)
>>> df
   0   1  sum
0  0   1    1
1  2   6    8
2  9  24   33
3 13  76   89
4  4  12   16
```

See also:

parapply_summary() Merge results of parapply using applied function

splitrun() Run a command in parallel on a split file

`fyrd.helpers.parapply_summary(jobs, df, func, args=(), profile=None, applymap=False, name='parapply', imports=None, direct=True, **kwds)`

Run parapply for a function with summary stats.

Instead of returning the concatenated result, merge the result using the same function as was used during apply. This works best for summary functions like `.mean()`, which do a linear operation on a whole dataframe or series.

Parameters

- **jobs** (*int*) – Number of pieces to split the dataframe into
- **df** (*DataFrame*) – Any pandas DataFrame
- **args** (*tuple*) – Positional arguments to pass to the function, keyword arguments can just be passed directly.
- **profile** (*str*) – A fyrd cluster profile to use
- **applymap** (*bool*) – Run `applymap()` instead of `apply()`
- **merge_axis** (*int*) – Which axis to merge on, 0 or 1, default is 1 as `apply` transposes columns
- **merge_apply** (*bool*) – Apply the function on the merged dataframe also
- **name** (*str*) – A prefix name for all of the jobs
- **imports** (*list*) – A list of imports in any format, e.g. `['import numpy', 'scipy', 'from numpy import mean']`
- **direct** (*bool*) – Whether to run the function directly or to return a Job. Default True.
- **keyword arguments recognized by fyrd will be used for job** (*Any*) –
- **submission.** –
- **keyword arguments will be passed to DataFrame.apply()** (**Additional*) –

Returns A recombined DataFrame

Return type DataFrame

Example

```
>>> import numpy
>>> import pandas
>>> import fyrd
>>> df = pandas.DataFrame([[0, 1], [2, 6], [9, 24], [13, 76], [4, 12]])
>>> df = fyrd.helpers.parapply_summary(2, df, numpy.mean)
>>> df
0      6.083333
1     27.166667
dtype: float64
```

parapply() Run a command in parallel on a DataFrame without merging the

result()

fyrd.helpers.splitrun (*jobs, infile, inheader, command, args=None, kwargs=None, name=None, qtype=None, profile=None, outfile=None, outheader=False, merge_func=None, direct=True, **kws*)

Split a file, run command in parallel, return result.

This function will split a file into however many pieces are requested with the jobs argument, and run command on each.

Accepts exactly the same arguments as the Job class, with the exception of the first three and last four arguments, which are:

- the number of jobs
- the file to work on
- whether the input file has a header
- an optional output file
- whether the output file has a header
- an optional function to use to merge the resulting list, only used if there is no outfile.
- whether to run directly or to return a Job. If direct is True, this function will just run and thus block until complete, if direct is False, the function will submit as a Job and return that Job.

Note: If command is a string, `format(file={file})` will be called on it, where file is each split file. If command is a function, there must be an argument in either args or kwargs that contains `{file}`. It will be replaced with the *path to the file*, again by the format command.

If outfile is specified, there must also be an '{outfile}' line in any script or an '{outfile}' argument in either args or kwargs. When this function completes, the file at outfile will contain the concatenated output files of all of the jobs.

If the 'clean_files' and 'clean_outputs' arguments are not passed, we delete all intermediate files and output files by default.

The intermediate files will be stored in the 'scriptpath' directory.

Any header line is kept at the top of the file.

Primary return value varies and is decided in this order:

If outfile: the absolute path to that file

If merge_func: the result of merge_func(list), where list is the list of outputs.

Else: a list of results

If direct is False, this function returns a `fyrd.job.Job` object which will return the results described above on `get()`.

Parameters

- **jobs** (*int*) – Number of pieces to split the dataframe into
- **infile** (*str*) – The path to the file to be split.
- **inheader** (*bool*) – Does the input file have a header?
- **command** (*function/str*) – The command or function to execute.
- **args** (*tuple/dict*) – Optional arguments to add to command, particularly useful for functions.
- **kwargs** (*dict*) – Optional keyword arguments to pass to the command, only used for functions.
- **name** (*str*) – Optional name of the job. If not defined, guessed. If a job of the same name is already queued, an integer job number (not the queue number) will be added, ie. `<name>.1`

- **qtype** (*str*) – Override the default queue type
- **profile** (*str*) – The name of a profile saved in the conf
- **outfile** (*str*) – The path to the expected output file.
- **outheader** (*bool*) – Does the input outfile have a header?
- **merge_func** (*function*) – An optional function used to merge the output list if there is no outfile.
- **direct** (*bool*) – Whether to run the function directly or to return a Job. Default True.
- **other keywords are parsed into cluster keywords by the options (*All)** –
- **For available keywords see `fyrd.option_help()` *(*system.*)** –

Returns See description above

Return type Varies

7.7 fyrd.basic

This module holds high level functions to make job submission easy, allowing the user to skip multiple steps and to avoid using the `Job` class directly.

`submit()`, `make_job()`, and `make_job_file()` all create `Job` objects in the background and allow users to submit jobs. All of these functions accept the exact same arguments as the `Job` class does, and all of them return a `Job` object.

`submit_file()` is different, it simply submits a pre-formed job file, either one that has been written by this software or by any other method. The function makes no attempt to fix arguments to allow submission on multiple clusters, it just submits the file.

`clean()` takes a list of job objects and runs the `clean()` method on all of them, `clean_dir()` uses known directory and suffix information to clean out all job files from any directory.

`fyrd.basic.submit()`

Submit a script to the cluster.

Parameters

- **command** (*function/str*) – The command or function to execute.
- **args** (*tuple/dict, optional*) – Optional arguments to add to command, particularly useful for functions.
- **kwargs** (*dict, optional*) – Optional keyword arguments to pass to the command, only used for functions.
- **name** (*str, optional*) – Optional name of the job. If not defined, guessed. If a job of the same name is already queued, an integer job number (not the queue number) will be added, ie. <name>.1
- **qtype** (*str, optional*) – Override the default queue type
- **profile** (*str, optional*) – The name of a profile saved in the conf
- **queue** (`fyrd.queue.Queue`, *optional*) – An already initiated Queue class to use.
- **kwds** – All other keywords are parsed into cluster keywords by the options system. For available keywords see `fyrd.option_help()`

Returns**Return type** Job object`fyrd.basic.make_job()`

Make a job compatible with the chosen cluster but do not submit.

Parameters

- **command** (*function/str*) – The command or function to execute.
- **args** (*tuple/dict, optional*) – Optional arguments to add to command, particularly useful for functions.
- **kwargs** (*dict, optional*) – Optional keyword arguments to pass to the command, only used for functions.
- **name** (*str, optional*) – Optional name of the job. If not defined, guessed. If a job of the same name is already queued, an integer job number (not the queue number) will be added, ie. <name>.1
- **qtype** (*str, optional*) – Override the default queue type
- **profile** (*str, optional*) – The name of a profile saved in the conf
- **queue** (`fyrd.queue.Queue`, *optional*) – An already initiated Queue class to use.
- **kwds** – *All other keywords are parsed into cluster keywords by the options system. For available keywords see `fyrd.option_help()`*

Returns**Return type** Job object`fyrd.basic.make_job_file()`

Make a job file compatible with the chosen cluster.

Parameters

- **command** (*function/str*) – The command or function to execute.
- **args** (*tuple/dict, optional*) – Optional arguments to add to command, particularly useful for functions.
- **kwargs** (*dict, optional*) – Optional keyword arguments to pass to the command, only used for functions.
- **name** (*str, optional*) – Optional name of the job. If not defined, guessed. If a job of the same name is already queued, an integer job number (not the queue number) will be added, ie. <name>.1
- **qtype** (*str, optional*) – Override the default queue type
- **profile** (*str, optional*) – The name of a profile saved in the conf
- **queue** (`fyrd.queue.Queue`, *optional*) – An already initiated Queue class to use.
- **kwds** – *All other keywords are parsed into cluster keywords by the options system. For available keywords see `fyrd.option_help()`*

Returns Path to job file**Return type** `str``fyrd.basic.submit_file()`

Submit an existing job file to the cluster.

This function is independent of the Job object and just submits a file using a cluster appropriate method.

Parameters

- **script_file** (*str*) – The path to the file to submit
- **dependencies** (*str or list of strings, optional*) – A job number or list of job numbers to depend on
- **qtype** (*str, optional*) – The name of the queue system to use, auto-detected if not given.
- **submit_args** (*dict*) – A dictionary of keyword arguments for the submission script.

Returns **job_number**

Return type *str*

`fyrd.basic.clean()`

Delete all files in jobs list or single Job object.

Parameters

- **jobs** (*fyrd.job.Job or list of fyrd.job.Job*) – Job objects to clean
- **clean_outputs** (*bool*) – Also clean outputs.

`fyrd.basic.clean_dir()`

Delete all files made by this module in directory.

CAUTION: The clean() function will delete EVERY file with

extensions matching those these:: `.<suffix>.err` `.<suffix>.out` `.<suffix>.out.func.pickle` `.<suffix>.sbatch` & `.<suffix>.script` for slurm mode `.<suffix>.qsub` for torque mode `.<suffix>.job` for local mode `_func.<suffix>.py` `_func.<suffix>.py.pickle.in_func.<suffix>.py.pickle.out`

Note: This function will change in the future to use batch system defined paths.

Parameters

- **directory** (*str*) – The directory to run in, defaults to the current directory.
- **suffix** (*str*) – Override the default suffix.
- **qtype** (*str*) – Only run on files of this qtype
- **confirm** (*bool*) – Ask the user before deleting the files
- **delete_outputs** (*bool*) – Delete all output files too.

Returns A set of deleted files

Return type *list*

7.8 fyrd.run

A library of useful functions used throughout the *fyrd* package.

These include functions to handle data, format outputs, handle file opening, run commands, check file extensions, get user input, and search and format imports.

These functions are not intended to be accessed directly and so documentation is limited.

exception `fyrd.run.CommandError`

Bases: `Exception`

A custom exception.

class `fyrd.run.CustomFormatter` (*prog*, *indent_increment=2*, *max_help_position=24*,
width=None)

Bases: `argparse.ArgumentParser`, `argparse.RawDescriptionHelpFormatter`

Custom argparse formatting.

`fyrd.run.block_read` (*files*, *size=65536*)

Iterate through a file by blocks.

`fyrd.run.check_pid` (*pid*)

Check For the existence of a unix pid.

`fyrd.run.cmd` (*command*, *args=None*, *stdout=None*, *stderr=None*, *tries=1*)

Run command and return status, output, stderr.

Parameters

- **command** (*str*) – Path to executable.
- **args** (*tuple*, *optional*) – Tuple of arguments.
- **stdout** (*str*, *optional*) – File or open file like object to write STDOUT to.
- **stderr** (*str*, *optional*) – File or open file like object to write STDERR to.
- **tries** (*int*, *optional*) – Number of times to try to execute. 1+

Returns

- **exit_code** (*int*)
- **STDOUT** (*str*)
- **STDERR** (*str*)

`fyrd.run.cmd_or_file` (*string*)

If string is a file, return the contents, else return the string.

Parameters **string** (*str*) – Path to a file or any other string

Returns **script** – Either the contents of the file if string is a file or just the contents of string.

Return type *str*

`fyrd.run.count_lines` (*infile*, *force_blocks=False*)

Return the line count of a file as quickly as possible.

Uses *wc* if available, otherwise does a rapid read.

`fyrd.run.exp_file` (*infile*)

Return an expanded path to a file.

`fyrd.run.export_globals` (*function*)

Add a function's globals to the current globals.

`fyrd.run.export_imports` (*function*, *kwds*)

Get imports from a function and from kwds.

Also sets globals and adds path to module to sys path.

Parameters

- **function** (*callable*) – A function handle
- **kwds** (*dict*) – A dictionary of keyword arguments

Returns imports + sys.path.append for module path

Return type `list`

`fyrd.run.export_run` (*function, args, kwargs*)

Execute a function after first exporting all imports.

`fyrd.run.file_getter` (*file_strings, variables, extra_vars=None, max_count=None*)

Get a list of files and variable values using the search string.

The file strings can contain standard unix glob (like `*`) and variable containing strings in the form `{name}`.

For example, a file_string of `{dir}/*.txt` will match every file that ends in `.txt` in every directory relative to the current path.

The result for a directory name test with two files named 1.txt and 2.txt is a list of:

```
[('dir/1.txt'), {'dir': 'test'}],
 ('dir/2.txt'), {'dir': 'test'}]]
```

This is repeated for every file_string in file_strings, and the following tests are done:

1. All file_strings must result in identical numbers of files
2. All variables must have only a single value in every file string

If there are multiple file_strings, they are added to the result `x` in order, but the dictionary remains the same as variables must be shared. If multiple file_strings are provided the results are combined by alphabetical order.

Parameters

- **file_strings** (*list of str*) – List of search strings, e.g. `*/*`, `*/*.txt`, `{dir}/*.txt` or `{dir}/{file}.txt`
- **variables** (*list of str*) – List of variables to look for
- **extra_vars** (*list of str, optional*) – A list of additional variables specified in a very precise format:

```
new_var:orig_var:regex:sub_str

or

new_var:value
```

The `orig_var` must correspond to a variable in `variables`. `var` will be generated by running `re.sub(regex, sub_str, string)` where `string` is the result of `orig_var` for the given file set

- **max_count** (*int, optional*) – Max number of file_strings to parse, default is all.

Returns

A list of files. Each list item will be a two-item tuple of (*files, variables*). Files will be a tuple with the same length as `max_count`, or `file_strings` if `max_count` is `None`. Variables will be a dictionary of all variables and `extra_vars` for this file set. e.g.:

```
[((file1, dir1, file2), {var1: val, var2: val})]
```

Return type `list`

Raises `ValueError` – Raised if any of the above tests are not met.

`fyrd.run.file_type(infile)`

Return file type after stripping gz or bz2.

`fyrd.run.get_all_imports(function, kwds, prot=False)`

Get all imports from a function and from kwds.

Parameters

- **function** (*callable*) – A function handle
- **kwds** (*dict*) – A dictionary of keyword arguments
- **prot** (*bool*) – Wrap all import in try statement

Returns Imports

Return type *list*

`fyrd.run.get_function_path(function)`

Return path to module defining a function if it exists.

`fyrd.run.get_imports(function, mode='string')`

Build a list of potentially useful imports from a function handle.

Gets:

- All modules from `globals()`
- All modules from the function's `globals()`
- All functions from the function's `globals()`

Modes:

string: Return a list of strings formatted as unprotected import calls

prot: Similar to string, but with `try..except` blocks

list: Return two lists: (import name, module name) for modules and (import name, function name, module name) for functions

Parameters

- **function** (*callable*) – A function handle
- **mode** (*str*) – A string corresponding to one of the above modes

Returns

Return type *str* or *list*

`fyrd.run.get_input(message, valid_answers=None, default=None)`

Get input from the command line and check answers.

Allows input to work with python 2/3

Parameters

- **message** (*str*) – A message to print, an additional space will be added.
- **valid_answers** (*list*) – A list of answers to accept, if None, ignored. Case insensitive. There is one special option here: 'yesno', this allows all case insensitive variations of y/n/yes/no.
- **default** (*str*) – The default answer.

Returns response

Return type `str`

`fyrd.run.get_pbar(iterable, name=None, unit=None, **kwargs)`
Return a tqdm progress bar iterable.

If progressbar is set to False in the config, will not be shown.

`fyrd.run.get_ynsno(message, default=None)`
Get yes/no answer from user.

Parameters

- **message** (`str`) – A message to print, an additional space will be added.
- **default** (`{'y', 'n'}`, *optional*) – One of `{'y', 'n'}`, the default if the user gives no answer. If None, answer forced.

Returns True on yes, False on no

Return type `bool`

`fyrd.run.import_function(function, mode='string')`
Return an import string for the function.

Attempts to resolve the parent module also, if the parent module is a file, ie it isn't `__main__`, the import string will include a call to `sys.path.append` to ensure the module is importable.

If this function isn't defined by a module, returns an empty string.

Parameters **mode** (`{'string', 'list'}`, *optional*) – string/list, return as a unified string or a list.

`fyrd.run.indent(string, prefix='')`
Replicate python3's `textwrap.indent` for python2.

Parameters

- **string** (`str`) – Any string.
- **prefix** (`str`) – What to indent with.

Returns Indented string

Return type `str`

`fyrd.run.is_exc(x)`
Check if x is the output of `sys.exc_info()`.

Returns True if matched the output of `sys.exc_info()`.

Return type `bool`

`fyrd.run.is_exe(fpath)`
Return True if fpath is executable.

`fyrd.run.is_file_type(infile, types)`
Return True if infile is one of types.

Parameters

- **infile** (`str`) – Any file name
- **types** (`list`) – String or list/tuple of strings (e.g `['bed', 'gtf']`)

Returns `is_file_type`

Return type `bool`

`fyrd.run.listify(iterable)`

Try to force any iterable into a list sensibly.

`fyrd.run.merge_lists(lists)`

Turn a list of lists into a single list.

`fyrd.run.normalize_imports(imports, prot=True)`

Take a heterogenous list of imports and normalize it.

Parameters

- **imports** (*list*) – A list of strings, formatted differently.
- **prot** (*bool*) – Protect imports with try..except blocks

Returns A list of strings that can be used for imports

Return type *list*

`fyrd.run.open_zipped(infile, mode='r')`

Open a regular, gzipped, or bz2 file.

If infile is a file handle or text device, it is returned without changes.

Returns

Return type text mode file handle.

`fyrd.run.opt_split(opt, split_on)`

Split options by chars in split_on, merge all into single list.

Parameters

- **opt** (*list*) – A list of strings, can be a single string.
- **split_on** (*list*) – A list of characters to use to split the options.

Returns A single merged list of split options, uniqueness guaranteed, order not.

Return type *list*

`fyrd.run.parse_glob(string, get_vars=None)`

Return a list of files that match a simple regex glob.

Parameters

- **string** (*str*) –
- **get_vars** (*list*) – A list of variable names to search for. The string must contain these variables in the form *{variable}*. These variables will be temporarily replaced with a * and then run through *glob.glob* to generate a list of files. This list is then parsed to create the output.

Returns

Keys are all files that match the string, values are None if *get_vars* is not passed. If *get_vars* is passed, the values are dictionaries of *{'variable': 'result'}*. e.g. for *{name}.txt* and *hi.txt*:

```
{hi.txt: {name: 'hi'}}
```

Return type *dict*

Raises *ValueError* – If blank or numeric variable names are used or if *get_vars* returns multiple different names for a file.

`fyrd.run.replace_argument(args, find_string, replace_string, error=True)`

Replace `find_string` with `replace_string` in a tuple or dict.

If dict, the values are replaced, not the keys.

Note: `args` can also be a list, in which case the first item is assumed to be a tuple, and the second a dictionary

Parameters

- **args** (*list/tuple/dict*) – Tuple or dict of args
- **find_string** (*str*) – A string to search for
- **replace_string** (*str*) – A string to replace with
- **error** (*bool*) – Raise `ValueError` if replacement fails

Returns

Return type The same object as was passed, with alterations made.

`fyrd.run.split_file(infile, parts, outpath="", keep_header=False)`

Split a file in parts and return a list of paths.

Note: Linux specific (uses `wc`).

If `has_header` is `True`, the top line is stripped off the `infile` prior to splitting and assumed to be the header.

Parameters

- **outpath** (*str, optional*) – The directory to save the split files.
- **keep_header** (*bool, optional*) – Add the header line to the top of every file.

Returns Paths to split files.

Return type `list`

`fyrd.run.string_getter(string)`

Parse a string for `{}`, `{#}`, and `{string}`.

Parameters **string** (*str*) –

Returns

- **ints** (*set*) – A set of ints containing all `{#}` values
- **vrs** (*set*) – A set of `{string}` values

Raises `ValueError` – If both `{}` and `{#}` are passed

`fyrd.run.syspath_fmt(syspath)`

Take a list of paths and return a `sys` of `sys.path.append` strings.

`fyrd.run.update_syspaths(function, kwds=None)`

Add function path to 'syspaths' in `kwds`.

`fyrd.run.which(program)`

Replicate the UNIX `which` command.

Taken verbatim from: stackoverflow.com/questions/377017/test-if-executable-exists-in-python

Parameters **program** (*str*) – Name of executable to test.

Returns Path to the program or `None` on failure.

Return type `str` or `None`

`fyrd.run.write_iterable(iterable, outfile)`
Write all elements of iterable to outfile.

7.9 fyrd.logme

This is a package I wrote myself and keep using because I like it. It provides syslog style leveled logging (e.g. ‘debug’->‘info’->‘warn’->‘error’->‘critical’) and it implements colors and timestamped messages.

The minimum print level can be set module wide at runtime by changing `cluster.logme.MIN_LEVEL`.

`fyrd.logme.log(message, level='info', logfile=None, also_write=None, min_level=None, kind=None)`
Print a string to logfile.

Levels display as:

```
verbose: <timestamp> VERBOSE -->
debug:   <timestamp> DEBUG  -->
info:    <timestamp> INFO   -->
warn:    <timestamp> WARNING -->
error:   <timestamp> ERROR  -->
critical: <timestamp> CRITICAL -->
```

Parameters

- **message** (*str*, *optional*) – The message to print.
- **logfile** (*file or logging object*, *optional*) – Optional file to log to, defaults to `STDERR`. Can provide a logging object
- **level** (*{'debug', 'info', 'warn', 'error', 'normal'}*, *optional*) – Will only print if `level > MIN_LEVEL`
- **also_write** (*{'stdout', 'stderr'}*, *optional*) – Print to `STDOUT` or `STDERR` also. These only have an effect if the output is not already set to the same device.
- **min_level** (*str*, *deprecated*) – Retained for backwards compatibility, `min_level` should be set using the `logme.MIN_LEVEL` constant.
- **kind** (*str*, *deprecated*) – synonym for `level`, kept to retain backwards compatibility

Logging with timestamps and optional log files.

Print a timestamped message to a logfile, `STDERR`, or `STDOUT`.

If `STDERR` or `STDOUT` are used, colored flags are added. Colored flags are `INFO`, `WARNING`, `ERROR`, or `CRITICAL`.

It is possible to write to both logfile and `STDOUT`/`STDERR` using the `also_write` argument.

If level is ‘error’ or ‘critical’, error is written to `STDERR` unless `also_write == -1`

`MIN_LEVEL` can also be provided, logs will only print if `vlevel > MIN_LEVEL`. Level order: `critical>error>warn>info>debug>verbose`

Usage:

```
import logme as lm
lm.log("Screw up!", <outfile>,
      level='debug'|'info'|'warn'|'error'|'normal',
      also_write='stderr'|'stdout')
```

Example:

```
lm.log('Hi')
Prints: 20160223 11:46:24.969 | INFO --> Hi
lm.log('Hi', level='debug')
Prints nothing
lm.MIN_LEVEL = 'debug'
lm.log('Hi', level='debug')
Prints: 20160223 11:46:24.969 | DEBUG --> Hi
```

Note: Uses terminal colors and STDERR, not compatible with non-unix systems

`fyrd.logme.log` (*message*, *level*=`'info'`, *logfile*=`None`, *also_write*=`None`, *min_level*=`None`, *kind*=`None`)
Print a string to logfile.

Levels display as:

```
verbose: <timestamp> VERBOSE -->
debug:   <timestamp> DEBUG -->
info:    <timestamp> INFO -->
warn:    <timestamp> WARNING -->
error:   <timestamp> ERROR -->
critical: <timestamp> CRITICAL -->
```

Parameters

- **message** (*str*, *optional*) – The message to print.
- **logfile** (*file or logging object*, *optional*) – Optional file to log to, defaults to STDERR. Can provide a logging object
- **level** (`{'debug', 'info', 'warn', 'error', 'normal'}`, *optional*) – Will only print if level > MIN_LEVEL
- **also_write** (`{'stdout', 'stderr'}`, *optional*) – Print to STDOUT or STDERR also. These only have an effect if the output is not already set to the same device.
- **min_level** (*str*, *deprecated*) – Retained for backwards compatibility, `min_level` should be set using the `logme.MIN_LEVEL` constant.
- **kind** (*str*, *deprecated*) – synonym for level, kept to retain backwards compatibility

8.1 Version 0.6.211

This version adds bugfixes and stability over version 0.6.2a1.

8.2 Version 0.6.2a1

This version brings a major overhaul to the structure of the code, while leaving the API *mostly* intact.

8.2.1 Major Changes

- Batch system definitions now fully modular and are contained in the `fyrd.batch_systems` package. `options.py` has also been moved into this package, which allows any programmer to add a new batch system definition to `fyrd` by just editing the contents of that small subpackaged
- Updated console script to allow running arbitrary shell scripts on the console with `fyrd run` or submitting any number of existing job files using `fyrd sub`. Added the new alias scripts `frun` and `fsub` for those new modes also. Both new modes will accept the `--wait` argument, meaning that they will block until the jobs complete.
- Documentation overhauled to update API and add instructions on creating a new batch system, these instructions are duplicated in the README within the `batch_systems` package folder.
- **Local support temporarily removed.** It didn't work very well, and it broke the new batch system structure, I hope to add it back again shortly.
- Full support for array job parsing for both torque and slurm. We now create one job entry for each array job child, instead of for each array job. To manage this, the `fyrd.queue.Queue.QueueJob` class was moved to `fyrd.queue.QueueJob` and split to add a child class, `fyrd.queue.QueueChild`. All array jobs not have one `fyrd.queue.QueueJob` job, plus one `fyrd.queue.QueueChild` job for each of their children, which are stored in the `children` dictionary in the `fyrd.queue.QueueJob` class.

- Added a `get` method to the `fyrd.queue.Queue` class to allow a user to get outputs from a list of jobs, loops continuously through the jobs so that jobs are not lost.
- Added `tqdm` as a requirement and enabled progressbars in multi-job wait and get

8.2.2 Minor Changes

- Updated the documentation to include this changelog, which will only contain change information for version 0.6.2a1 onwards.
- Added additional tests to cover the new changes as well as generally increase test suite coverage.
- Several small bug fixes
